AWS Cloud Practitioner – Cloud Computing Project

Project Documentation with Screenshot Evidence

1. Project Overview

This document records a practical AWS Cloud Computing project using the supplied screenshots as evidence. The project demonstrates cloud hosting, compute, notification, application deployment, and load balancing concepts.

2. AWS Services Demonstrated

Service	Demonstrated Activity
Amazon S3	Static website hosting and access through an S3 website endpoint
Amazon EC2	Linux and Windows virtual machine instances
Amazon SNS	Topic creation, confirmed email subscription, and message publication
Elastic Beanstalk	Healthy application environment launched
Application Load Balancer	Internet-facing ALB created and active
Apache HTTP Server	Installed and enabled on an Amazon Linux EC2 instance

3. Amazon S3 – Static Website Hosting

The screenshot shows a static NOVA website successfully displayed from an Amazon S3 website endpoint. This demonstrates S3 being used to host static web content.

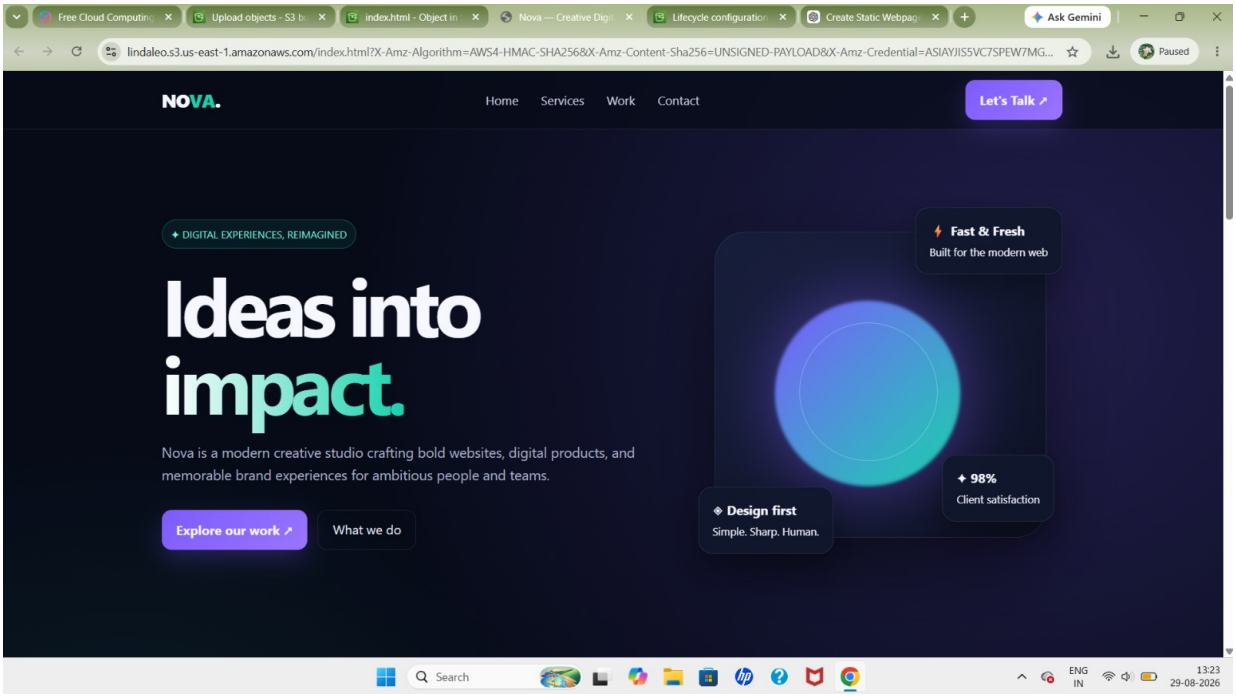

Figure 3: Amazon S3 – Deployed Static Website

4. Amazon EC2 – Compute Instances

The EC2 console screenshot shows instance state and configuration information including instance ID, instance type, public IPv4 address, VPC, subnet, and Availability Zone.

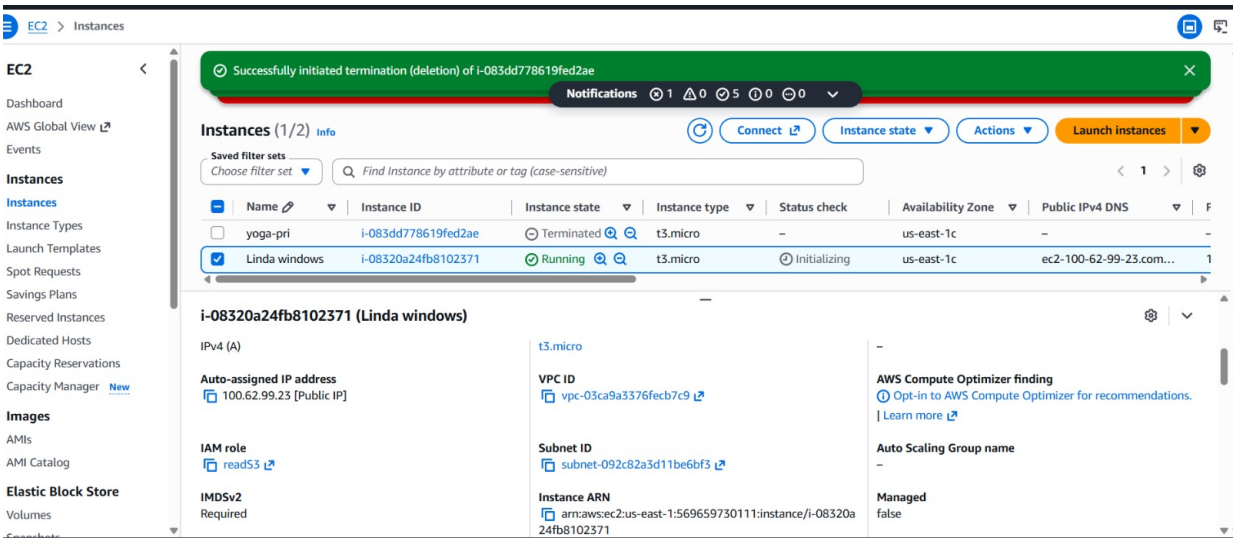

Figure 2: Amazon EC2 – Instances and Instance Details

5. Apache HTTP Server on EC2 Linux

The terminal screenshot shows Apache HTTP Server package installation followed by systemctl commands to enable and start the httpd service. An index.html file is written under /var/www/html.

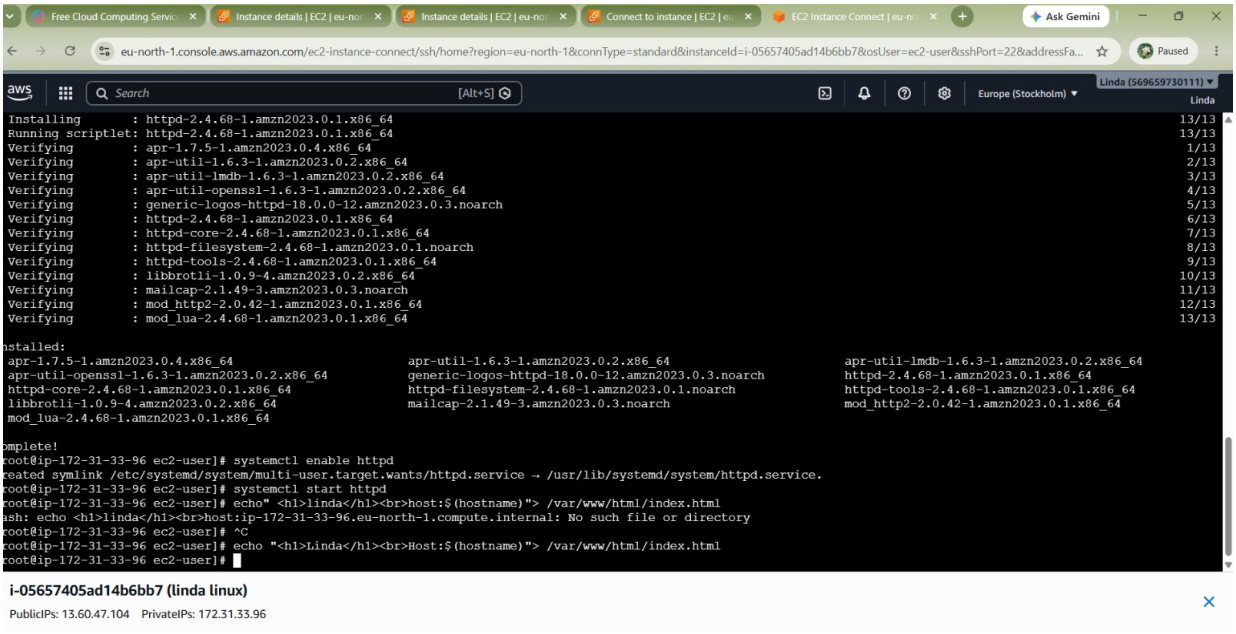

Figure 5: EC2 Linux – Apache HTTP Server Installation and Configuration

6. Amazon SNS – Notification Service

The SNS screenshot shows the collegenotification topic, a confirmed email subscription, and a successful message publication.

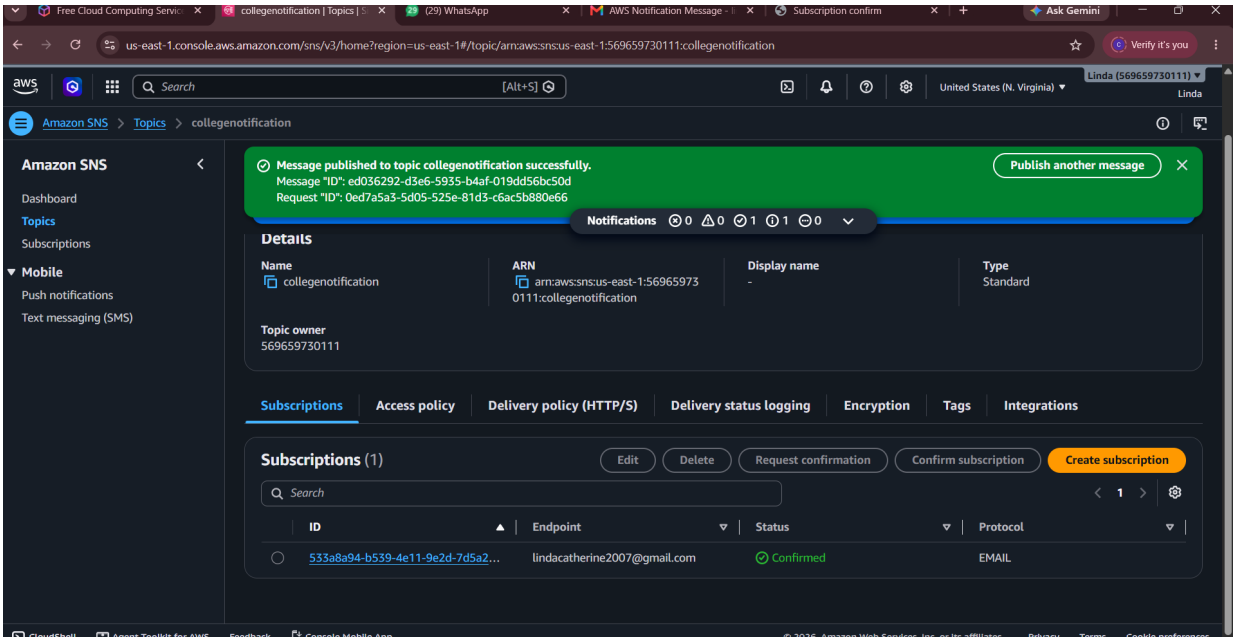

Figure 1: Amazon SNS – Topic and Confirmed Email Subscription

7. AWS Elastic Beanstalk

The Elastic Beanstalk console shows the CHARLIN-env environment successfully launched with health status OK and a Python platform.

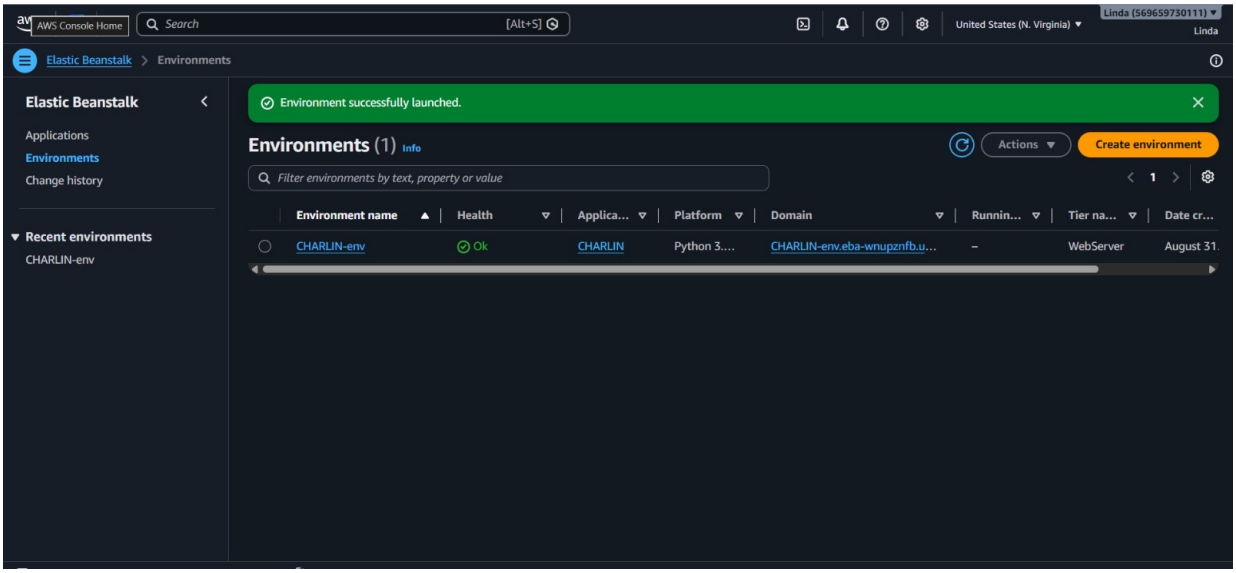

Figure 4: AWS Elastic Beanstalk – Healthy Environment

8. Application Load Balancer

The load balancer screenshot shows KRCE as an Application Load Balancer with an internet-facing scheme and Active status.

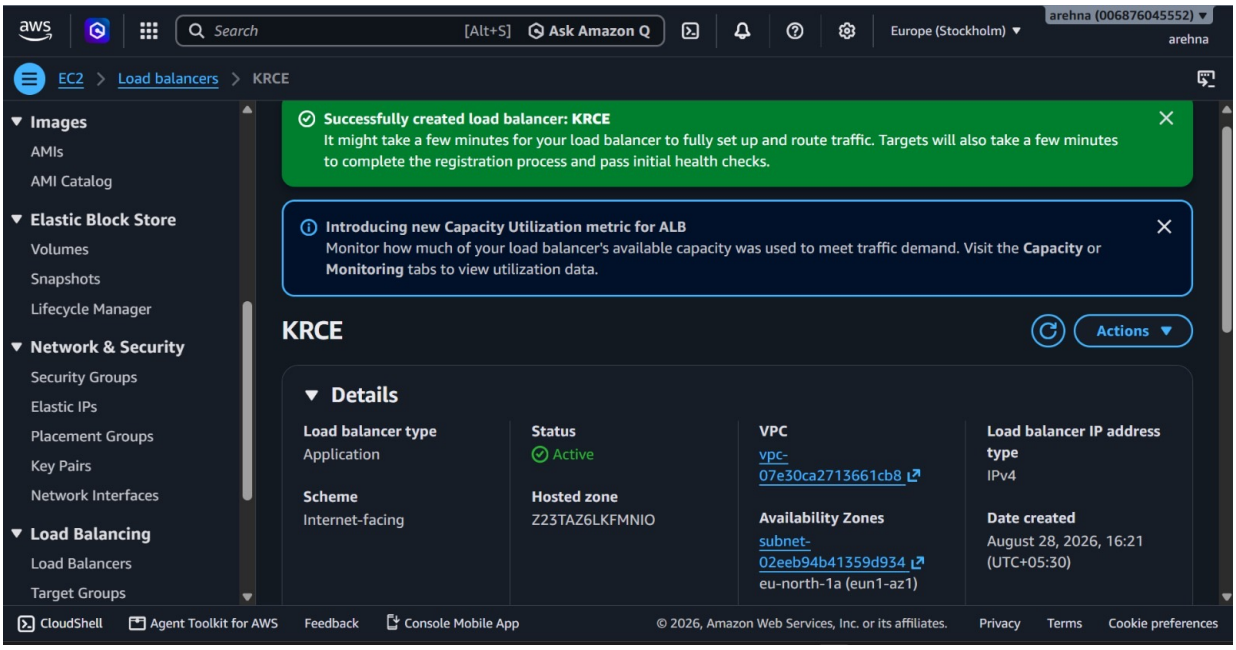

Figure 7: Application Load Balancer – KRCE, Active and Internet-facing

9. Supporting Windows Environment

A Windows desktop screenshot is included as supporting evidence of the project environment.

Figure 6: Windows Environment – Supporting Project Screenshot

10. Supporting Project File Screenshot

A Windows File Explorer screenshot is included as supporting project evidence.

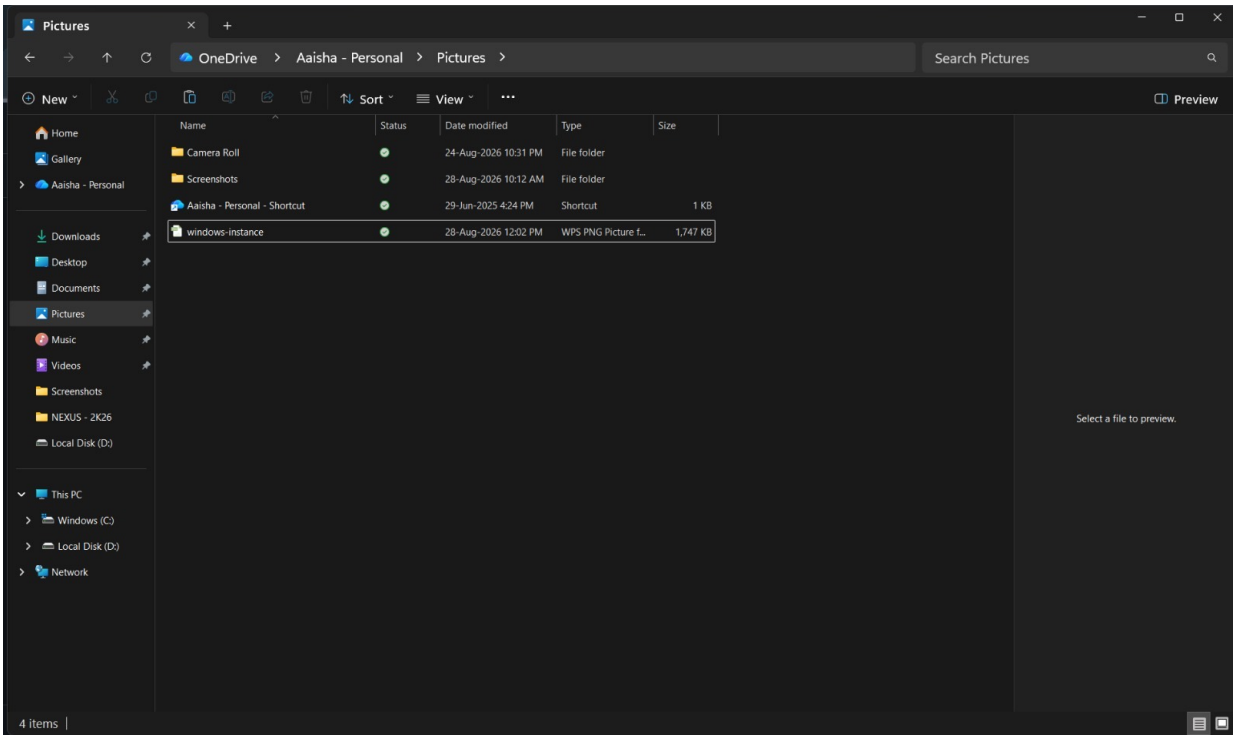

Figure 8: Local Project File – Supporting Screenshot

11. Key Learning Outcomes

• Cloud resource creation and management

• Static website hosting with Amazon S3

• Virtual machine deployment using Amazon EC2

• Linux web-server configuration using Apache

• Basic VPC, subnet, public IP, and Availability Zone concepts

• Notification delivery using Amazon SNS

• Managed application deployment using Elastic Beanstalk

• Internet-facing application load balancing

12. Conclusion

The project demonstrates practical exposure to major AWS services used for web hosting, compute, messaging, application deployment, and traffic distribution. The included screenshots provide visual evidence for the documented activities.
